

# The Belem Ecosocialist Declaration

Wednesday 21 January 2009, by [Collective / Multiple signers](#) (Date first published: 21 January 2009).

*“The world is suffering from a fever due to climate change, and the disease is the capitalist development model.”*

— Evo Morales, president of Bolivia, September 2007

## Humanity’s Choice

Humanity today faces a stark choice: ecosocialism or barbarism.

We need no more proof of the barbarity of capitalism, the parasitical system that exploits humanity and nature alike. Its sole motor is the imperative toward profit and thus the need for constant growth. It wastefully creates unnecessary products, squandering the environment’s limited resources and returning to it only toxins and pollutants. Under capitalism, the only measure of success is how much more is sold every day, every week, every year – involving the creation of vast quantities of products that are directly harmful to both humans and nature, commodities that cannot be produced without spreading disease, destroying the forests that produce the oxygen we breathe, demolishing ecosystems, and treating our water, air and soil like sewers for the disposal of industrial waste.

Capitalism’s need for growth exists on every level, from the individual enterprise to the system as a whole. The insatiable hunger of corporations is facilitated by imperialist expansion in search of ever greater access to natural resources, cheap labor and new markets. Capitalism has always been ecologically destructive, but in our lifetimes these assaults on the earth have accelerated. Quantitative change is giving way to qualitative transformation, bringing the world to a tipping point, to the edge of disaster. A growing body of scientific research has identified many ways in which small temperature increases could trigger irreversible, runaway effects – such as rapid melting of the Greenland ice sheet or the release of methane buried in permafrost and beneath the ocean – that would make catastrophic climate change inevitable.

Left unchecked, global warming will have devastating effects on human, animal and plant life. Crop yields will drop drastically, leading to famine on a broad scale. Hundreds of millions of people will be displaced by droughts in some areas and by rising ocean levels in others. Chaotic, unpredictable weather will become the norm. Air, water and soil will be poisoned. Epidemics of malaria, cholera and even deadlier diseases will hit the poorest and most vulnerable members of every society.

The impact of the ecological crisis is felt most severely by those whose lives have already been ravaged by imperialism in Asia, Africa, and Latin America, and indigenous peoples everywhere are especially vulnerable. Environmental destruction and climate change constitute an act of aggression by the rich against the poor.

Ecological devastation, resulting from the insatiable need to increase profits, is not an accidental feature of capitalism: it is built into the system’s DNA and cannot be reformed away. Profit-oriented production only considers a short-term horizon in its investment decisions, and cannot take into account the long-term health and stability of the environment. Infinite economic expansion is

incompatible with finite and fragile ecosystems, but the capitalist economic system cannot tolerate limits on growth; its constant need to expand will subvert any limits that might be imposed in the name of "sustainable development." Thus the inherently unstable capitalist system cannot regulate its own activity, much less overcome the crises caused by its chaotic and parasitical growth, because to do so would require setting limits upon accumulation – an unacceptable option for a system predicated upon the rule: Grow or Die!

If capitalism remains the dominant social order, the best we can expect is unbearable climate conditions, an intensification of social crises and the spread of the most barbaric forms of class rule, as the imperialist powers fight among themselves and with the global south for continued control of the world's diminishing resources.

At worst, human life may not survive.

### **Capitalist Strategies for Change**

There is no lack of proposed strategies for contending with ecological ruin, including the crisis of global warming looming as a result of the reckless increase of atmospheric carbon dioxide. The great majority of these strategies share one common feature: they are devised by and on behalf of the dominant global system, capitalism.

It is no surprise that the dominant global system which is responsible for the ecological crisis also sets the terms of the debate about this crisis, for capital commands the means of production of knowledge, as much as that of atmospheric carbon dioxide. Accordingly, its politicians, bureaucrats, economists and professors send forth an endless stream of proposals, all variations on the theme that the world's ecological damage can be repaired without disruption of market mechanisms and of the system of accumulation that commands the world economy.

But a person cannot serve two masters – the integrity of the earth and the profitability of capitalism. One must be abandoned, and history leaves little question about the allegiances of the vast majority of policy-makers. There is every reason, therefore, to radically doubt the capacity of established measures to check the slide to ecological catastrophe.

And indeed, beyond a cosmetic veneer, the reforms over the past thirty-five years have been a monstrous failure. Isolated improvements do of course occur, but they are inevitably overwhelmed and swept away by the ruthless expansion of the system and the chaotic character of its production.

One example demonstrates the failure: in the first four years of the 21<sup>st</sup> Century, global carbon emissions were nearly three times as great per annum as those of the decade of the 1990s, despite the appearance of the Kyoto Protocols in 1997.

Kyoto employs two devices: the "Cap and Trade" system of trading pollution credits to achieve certain reductions in emissions, and projects in the global south – the so-called "Clean Development Mechanisms" – to offset emissions in the highly industrialized nations. These instruments all rely upon market mechanisms, which means, first of all, that atmospheric carbon dioxide becomes a commodity under the control of the same interests that created global warming. Polluters are not compelled to reduce their carbon emissions, but allowed to use their power over money to control the carbon market for their own ends, which include the devastating exploration for yet more carbon-based fuels. Nor is there a limit to the amount of emission credits which can be issued by compliant governments.

Since verification and evaluation of results are impossible, the Kyoto regime is not only incapable of

controlling emissions, it also provides ample opportunities for evasion and fraud of all kinds. As even the Wall Street Journal put it in March, 2007, emissions trading “would make money for some very large corporations, but don’t believe for a minute that this charade would do much about global warming.”

The Bali climate meetings in 2007 opened the way for even greater abuses in the period ahead. Bali avoided any mention of the goals for drastic carbon reduction put forth by the best climate science (90% by 2050); it abandoned the peoples of the global south to the mercy of capital by giving jurisdiction over the process to the World Bank; and made offsetting of carbon pollution even easier.

In order to affirm and sustain our human future, a revolutionary transformation is needed, where all particular struggles take part in a greater struggle against capital itself. This larger struggle cannot remain merely negative and anti-capitalist. It must announce and build a different kind of society, and this is ecosocialism.

### **The Ecosocialist Alternative**

The ecosocialist movement aims to stop and to reverse the disastrous process of global warming in particular and of capitalist ecocide in general, and to construct a radical and practical alternative to the capitalist system. Ecosocialism is grounded in a transformed economy founded on the non-monetary values of social justice and ecological balance. It criticizes both capitalist “market ecology” and productivist socialism, which ignored the earth’s equilibrium and limits. It redefines the path and goal of socialism within an ecological and democratic framework.

Ecosocialism involves a revolutionary social transformation, which will imply the limitation of growth and the transformation of needs by a profound shift away from quantitative and toward qualitative economic criteria, an emphasis on use-value instead of exchange-value.

These aims require both democratic decision-making in the economic sphere, enabling society to collectively define its goals of investment and production, and the collectivization of the means of production. Only collective decision-making and ownership of production can offer the longer-term perspective that is necessary for the balance and sustainability of our social and natural systems.

The rejection of productivism and the shift away from quantitative and toward qualitative economic criteria involve rethinking the nature and goals of production and economic activity in general. Essential creative, non-productive and reproductive human activities, such as householding, child-rearing, care, child and adult education, and the arts, will be key values in an ecosocialist economy.

Clean air and water and fertile soil, as well as universal access to chemical-free food and renewable, non-polluting energy sources, are basic human and natural rights defended by ecosocialism. Far from being “despotic,” collective policy-making on the local, regional, national and international levels amounts to society’s exercise of communal freedom and responsibility. This freedom of decision constitutes a liberation from the alienating economic “laws” of the growth-oriented capitalist system.

To avoid global warming and other dangers threatening human and ecological survival, entire sectors of industry and agriculture must be suppressed, reduced, or restructured and others must be developed, while providing full employment for all. Such a radical transformation is impossible without collective control of the means of production and democratic planning of production and exchange. Democratic decisions on investment and technological development must replace control by capitalist enterprises, investors and banks, in order to serve the long-term horizon of society’s and nature’s common good.

The most oppressed elements of human society, the poor and indigenous peoples, must take full part in the ecosocialist revolution, in order to revitalize ecologically sustainable traditions and give voice to those whom the capitalist system cannot hear. Because the peoples of the global south and the poor in general are the first victims of capitalist destruction, their struggles and demands will help define the contours of the ecologically and economically sustainable society in creation. Similarly, gender equality is integral to ecosocialism, and women's movements have been among the most active and vocal opponents of capitalist oppression. Other potential agents of ecosocialist revolutionary change exist in all societies.

Such a process cannot begin without a revolutionary transformation of social and political structures based on the active support, by the majority of the population, of an ecosocialist program. The struggle of labour - workers, farmers, the landless and the unemployed - for social justice is inseparable from the struggle for environmental justice. Capitalism, socially and ecologically exploitative and polluting, is the enemy of nature and of labour alike.

Ecosocialism proposes radical transformations in:

1. the energy system, by replacing carbon-based fuels and biofuels with clean sources of power under community control: wind, geothermal, wave, and above all, solar power.
2. the transportation system, by drastically reducing the use of private trucks and cars, replacing them with free and efficient public transportation;
3. present patterns of production, consumption, and building, which are based on waste, inbuilt obsolescence, competition and pollution, by producing only sustainable and recyclable goods and developing green architecture;
4. food production and distribution, by defending local food sovereignty as far as this is possible, eliminating polluting industrial agribusinesses, creating sustainable agro-ecosystems and working actively to renew soil fertility.

To theorize and to work toward realizing the goal of green socialism does not mean that we should not also fight for concrete and urgent reforms right now. Without any illusions about "clean capitalism," we must work to impose on the powers that be - governments, corporations, international institutions - some elementary but essential immediate changes:

- \* drastic and enforceable reduction in the emission of greenhouse gases,
- \* development of clean energy sources,
- \* provision of an extensive free public transportation system,
- \* progressive replacement of trucks by trains,
- \* creation of pollution clean-up programs,
- \* elimination of nuclear energy, and war spending.

These and similar demands are at the heart of the agenda of the Global Justice movement and the World Social Forums, which have promoted, since Seattle in 1999, the convergence of social and environmental movements in a common struggle against the capitalist system.

Environmental devastation will not be stopped in conference rooms and treaty negotiations: only

mass action can make a difference. Urban and rural workers, peoples of the global south and indigenous peoples everywhere are at the forefront of this struggle against environmental and social injustice, fighting exploitative and polluting multinationals, poisonous and disenfranchising agribusinesses, invasive genetically modified seeds, biofuels that only aggravate the current food crisis. We must further these social-environmental movements and build solidarity between anticapitalist ecological mobilizations in the North and the South.

This Ecosocialist Declaration is a call to action. The entrenched ruling classes are powerful, yet the capitalist system reveals itself every day more financially and ideologically bankrupt, unable to overcome the economic, ecological, social, food and other crises it engenders. And the forces of radical opposition are alive and vital. On all levels, local, regional and international, we are fighting to create an alternative system based in social and ecological justice.
